# What Is Firewall Manager?

Firewall Manager is a **security management service in a single pane of glass**. This allows you to centrally set up and manage firewall rules across multiple AWS accounts and applications in **AWS Organizations**.

# Manage Security across Multiple Accounts

Using Firewall Manager, you can create new AWS WAF rules for your **Application Load Balancers, API gateways, and Amazon CloudFront distributions**. You can also mitigate DDoS attacks using AWS Shield Advanced for your Application Load Balancers, Elastic IP addresses, CloudFront distributions, and more.

# Benefits of Firewall Manager

## Simplify Management of Firewall Rules across Your Accounts

One single pane of glass allows you to manage security across multiple AWS services and accounts.

## Ensure Compliance of Existing and New Applications

Firewall Manager automatically enforces security policies that you create across existing and newly created resources, across multiple accounts.

EXAM TIPS

## AWS Firewall Manager

**See a scenario about multiple AWS accounts and resources that need to be secured centrally?**

**Think AWS Firewall Manager!**
