Automating the Reconnaissance

We will be automating our Reconnaissance process with tools like Photon and Sniper. So, lets get started

We will start with photon

Photon is an advanced web crawler and OSINT (Open-Source Intelligence) tool designed for thorough website analysis. It is capable of scanning websites comprehensively to uncover valuable information, including endpoints, vulnerabilities, and sensitive data.

- Use Photon for Recon

```
python3 photon.py -u swiggy.com --clone --dns --keys --wayback -l 3 -t 100
-v
```

Next we have Sn1per, which is an all-in-one vulnerability scanner and attack surface management tool which is designed for comprehensive penetration testing and vulnerability assessments.

- Use Sn1per for All-in-One Offensive recon

```
sudo sniper -t <target> -m
```
