

# TASKS TO COMPLETE

---

## Windows Software To-do list #3

- Download file:
  - Use HTTP requests.

Create a class called Operations. Inside the class create 2 functions called CommandParser and DownloadFile. CommandParser function will take the command as argument and it will call the corresponding function according to the command. If the command contains “download” keyword, Parser function must call DownloadFile() function.

***Use WebClient class in order to send HTTP requests and download files.***

Steps to do:

- Find the current user’s temporary folder by using **System.IO.Path.GetTempPath** method.
- Use **DownloadFile(Uri, String)** method of WebClient to download file into user’s temporary folder.

***If you are new to this concepts I highly encourage you to learn more about HTTP and WebClient class before continue.***
