Dynamic ARP Inspection (DAI)

- DAI is a security feature that validates Address Resolution Protocol (ARP) packets in a network.
- DAI allows a network administrator to intercept, log, and discard ARP packets with invalid MAC address to IP address bindings.
- This capability protects the network from certain "man-in-the-middle" attacks.

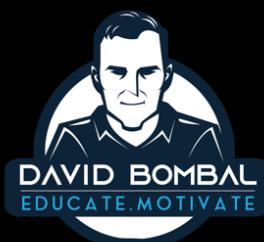

Requirements

- Either enable DHCP Snooping
- Or, manually configure entries

DAI Configuration

- Configuration examples per network diagram
 - Substitute VLAN 1 with your VLAN
 - Substitute g0/0 and g0/1 with the interfaces you use

DHCP Snooping Part 1:

- Enable DHCP snooping:
 - conf t
 - ip dhcp snooping
 - ip dhcp snooping vlan 1
 - no ip dhcp snooping information option
 - exit
 - show ip dhcp snooping

DHCP Snooping Part 2:

- Specify trusted ports:
 - conf t
 - int G0/0
 - ip dhcp snooping trust

DHCP Snooping Part 3:

- Rate limit untrusted ports (packets per second):
 - int G0/1
 - ip dhcp snooping limit rate 10
 - end

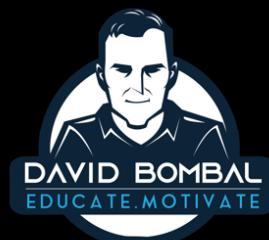

Verification

- Verify that it is working:
 - show ip dhcp snooping
 - debug ip dhcp snooping events
 - debug ip dhcp snooping packets

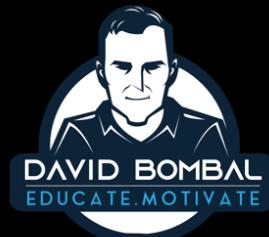

Another Option:

- If you don't want to use DHCP Snooping, manually configure entries:
 - conf t
 - arp access-list win10pc
 - permit ip host 10.1.1.1 mac host 1010.0001.0001
 - exit
 - ip arp inspection filter win10pc vlan 1
 - int G0/2
 - no ip arp inspection trust

Enable and verify DAI:

- Enable DAI:
 - conf t
 - ip arp inspection vlan 1
 - ip arp inspection validate src-mac
 - int G0/0
 - ip arp inspection trust
 - end
 - show ip arp inspection

DAI Rate limiting timers:

- Optional: Rate limiting recovery:
 - DAI rate limits by default (Whereas DHCP Snooping does not by default)
 - Default on untrusted ports is 15 packets per second (pps)
 - Trusted ports are not rate limited by default

DAI Rate limiting timers:

- Optional: Rate limiting recovery:
 - G0/0 uses a rate limit of 10 pps and burst of 1 second (default interval) = 10 pps
 - G0/1 uses a rate limit of 10 packets over a burst period of 5 seconds = 10 pps over 5 seconds
- conf t
- int G0/0
- ip arp inspection limit rate 10
- int g0/1
- ip arp inspection limit rate 10 burst interval 5
- end
- show ip arp inspection interfaces
